

Project Executable Files

Date	10 July 2026
Team ID	
Project Name	Credit Card Approval Prediction System
Maximum Marks	3 Marks

Project Executable Files

This document contains all executable and deployable files required to run the **Credit Card Approval Prediction System**. The project includes source code, trained machine learning models, datasets, documentation, and deployment files to allow the evaluator to execute the application successfully.

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	Yes
2	README / Setup Guide	Yes
3	requirements.txt	Yes
4	Database schema / Seed files (CSV Dataset)	Yes
5	Environment configuration file (.env.example)	No (Not Required)
6	Deployed Application URL	Yes (If deployed)
7	APK / Executable Binary	NA
8	Dockerfile / Containerization Config	No
9	Test Files and Test Results	Yes
10	Demo Video / Walkthrough	Yes (If required)

Step 2: File / Folder Structure

Step 3: Deployment / Access Details

Field	Details
Hosted / Deployed URL	https://creditcardapprovalprediction.onrender.com
Login Credentials (Demo)	Not Applicable <i>(The application does not require user authentication.)</i>
Platform / Hosting Provider	Render (Flask Application)
Repository Link	https://github.com/yellamandakiran/CreditCardApprovalPrediction
Demo Video Link	

Step 4: Run Instructions

Pre-requisites:

- **Windows 10/11 or Linux**
- **Python 3.10 or above**
- **Visual Studio Code (Recommended)**
- **Git (Optional)**
- **Internet connection (to install dependencies)**

Step-1: Clone the Repository

```
git clone https://github.com/yellamandakiran/CreditCardApprovalPrediction.git
```

Step-2: Open the Project Folder

```
cd Artificial-Intelligence-and-Machine-Learning
```

```
cd "5. Project Development Phase"
```

```
cd CreditCardApprovalPrediction
```

Step-3: Install Required Dependencies

```
pip install -r requirements.txt
```

Step-4: Train the Machine Learning Model

```
python train_model.py
```

This command performs:

- Dataset loading
- Data preprocessing
- Feature engineering
- Model training
- Model evaluation
- Saves model.pkl

Step-5: Run the Flask Application

```
python app.py
```

Step-6: Open the Application

Open your web browser and visit:

<http://127.0.0.1:5000>

Step-7: Test the Application

1. Enter the applicant's information.
2. Click **Predict**.
3. The system preprocesses the input.
4. The trained machine learning model predicts the result.
5. The application displays either:
 - **Credit Card Approved**
 - **Credit Card Rejected**

Expected Output

- Flask server starts successfully.
- Home page loads correctly.
- User enters applicant details.
- Machine learning model predicts the approval status.
- Prediction result is displayed instantly.

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1	Model accuracy depends on the quality and completeness of the training dataset.	Improve the dataset by adding more recent and balanced records. <i>(Future Enhancement)</i>
2	The application currently supports prediction for one applicant at a time.	Batch prediction can be implemented in future versions. <i>(Planned)</i>
3	The application is currently deployed for demonstration purposes and does not include user authentication or database storage.	Future versions will include secure login, database integration, and cloud-based user management. <i>(Future Enhancement)</i>
