

Project Initialization and Planning Phase

Date	8 July 2026
Team ID	
Project Name	Credit Card Approval Prediction System
Maximum Marks	3 Marks

Define Problem Statements (Customer Problem Statement):

Banks and financial institutions process thousands of credit card applications every day. Manual evaluation of these applications is time-consuming, prone to human error, and inefficient, especially when assessing applicants based on income, employment history, credit records, and other financial information. There is a need for an intelligent system that can automatically analyze applicant data and accurately predict whether a credit card application is likely to be approved or rejected. This project addresses that need by using machine learning algorithms to automate the credit card approval process, improve decision-making, reduce processing time, and assist both banking professionals and customers through a user-friendly web application.

Example:

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	A Prospective Credit Card Customer	Check my credit card eligibility before submitting an application.	I am unsure whether I qualify for a credit card based on my financial profile.	Banks consider factors such as income, employment status, and credit history before approving applications.	Better informed about my eligibility and more confident before submitting a formal application.
PS-2	A Customer	Check if I am eligible for a credit card.	I don't know if my application will be approved.	My income and credit history affect approval.	Better informed before applying.
